PROGCON - CHAPTER 2

	shocked by: EMTENER TIGGOD
CLASS NUMBER: #OY	checked by: EMTENER TIGEON SECTION: TM 191
NAME: Alegro, Beatrice C.	DATE: November 08, 2019
PART 1: Identify the following.	19
Data type 1. A classification that describes what values can be assigne types of operations can be performed with the variable. A diagram that illustrates modules' relationships to each a program, along with the chord collection. A measure of the degree to which all the module statement that response should be formatted. Portable 6. A module that can more easily be reused in multiple program, along with the control of the degree to which all the module statement that response should be formatted. Portable 6. A module that can more easily be reused in multiple program point 7. A number with decimal places. Identifier 8. A program component's name. Numeric Contant 9. A specific numeric value. Declaration 10. A statement that provides a data type and an identifier for	other. th its type, size, and description. ents contribute to the same task. for a response and perhaps explain rams.
Hungarion 11. A variable-naming convention in which a variable's data to Notation part of its name.	
lyteger 12. A whole number.	
binaryoperator 13 An operator that requires two operands—one on each sic	
Magic Number 14. An unnamed constant whose purpose is not immediately Right-associativity. Assigns a value from the right of an assignment operator or now to left of the assignment operator. Assignment Statement	to the variable or constant on the left
Alphanuncic Values 16. Can contain alphabetic characters, numbers, and punctua	ation.
Fey words 17. Constitute the limited word set that is reserved in a langu	age.
Model Logiu 18. Contains all the statements in the module.	
Annu takim by 19 Contains information that expands on what appears in an often represented by a three-sided box that is connected line.	nother flowchart symbol; it is most to the step it references by a dashed
Self-downaring 20. Contains meaningful data and module names that descrit	be the program's purpose.

ight-associativity or right - to-left associativity 21 Describe operators that evaluate the expression to the right first.	
ight-associativity or hight	
Left associativity 23. Describes operators that evaluate the expression to the left first. left - to -night associativity	iti
Over head 24. Describes the extra resources a task requires.	-
25. Describes the extra resources a task requires.	
1/09/4 / //-	
mscope 26. Describes the state of data that is visible.	
Control 27 Describes the unknown value stored in an unassigned variable.	
Local 28. Describes variables that are declared within the module that uses them.	
716b at 29 Describes variables that are known to an entire program.	
Rules of precedences. Dictate the order in which operations in the same statement are carried out.	
txternal Documentation that is outside a coded program.	
Documentation within a coded program.	
Ryal numbers 33. Floating-point numbers.	
Find of 500-tacked. Hold the steps you take at the end of the program to finish the application.	
Hour kee pwg - tack 35. Include steps you must perform at the beginning of a program to get ready for the rest of the	
program.	
Detail loop tasks 36. Include the steps that are repeated for each set of input data.	
Modult Hender 37. Includes the module identifier and possibly other necessary identifying information.	
Luner council costing 8. Is another name for the camel casing naming convention.	
19. Is sometimes used as the name for the style that uses dashes to separate parts of a name.	
module return 40 Marks the end of the module and identifies the point at which control returns to the program or	
Hatement module that called the module.	
standing to the standard of th	
Numchic Vandly one that can hold digits, have mathematical operations performed on it, and usually can hold a	
decimal point and a sign indicating positive or negative.	
Main Program 42. Runs from start to stop and calls other modules. Named Constant 43. Similar to a variable, except that its value cannot change after the first assignment.	
modules as subroutines, procedures, functions, or methods.	
wificult that the act of assigning its first value, often at the same time the variable is created.	
the act of containing a task's instructions in a module.	
Function of position . The act of reducing a large program into more manageable modules.	
Enchoing input 48. The act of repeating input back to a user either in a subsequent prompt or in output.	
Assignment operations. The equal sign; it is used to assign a value to the variable or constant on its left.	
Reuse biling 50. The feature of modular programs that allows individual modules to be used in a variety of	

applications.

51. The feature of modular programs that assures you a module has been tested and proven to function correctly.

52. The format for naming variables in which the initial letter is lowercase, multiple-word variable names are run together, and each new word within the variable name begins with an uppercase letter.

The format for naming variables in which the initial letter is uppercase, multiple-word variable Pascal casing names are run together, and each new word within the variable name begins with an uppercase letter.

Mounting logic 54. The logic that appears in a program's main module; it calls other modules.

55. The memory address identifier to the left of an assignment operator. Lvalue

Modwlorizations6. The process of breaking down a program into modules.

Abstraction 57. The process of paying attention to important properties while ignoring nonessential details.

Call a Wodul- 58. To use the module's name to invoke it, causing it to execute.

Program level 59. Where global variables are declared.

60. Written explanations that are not part of the program logic but that serve as documentation for those reading the program.

Choose from the following

21 Global

22. Hierarchy chart
23. Housekeeping tasks
24. Hungarian notation
25. Identifier
26 In scope
27. Initializing the variable
28. Integer
29. Internal documentation
30 Kebob case
31. Keywords
32. Left-to-right associativity
3 3. Local

30 Kebob case
31. Keywords
32. Left-to-right associativity
3 3. Local
34. Lower camel casing
35_tvalue
36. Magic number
37. Main program
38. Mainline logic
39. Modularization
40. Module body
41. Module header

43. Modules
44. Named constant
45. Numeric
44 Numeric constant (literal
numeric constant)
47. Numeric variable
48. Order of operations
49. Overhead
50. Pascal casing
51 Portable
52 Program comments
53. Program level
54. Prompt
55. Real numbers
56. Reliability
57. Reusability
58. Right-associativity and
right-to-left associativity
59. Rules of precedence
60. Self-documenting

42. Module return statement

(32)
